

REAL-WORLD DATA PROJECT

Weather Data Analysis of India (1901–2017)

Abstract

This project analyzes India's weather data from 1901–2017 using data analytics and visualization techniques.

Introduction

Weather analysis helps identify climate patterns and supports forecasting and environmental planning.

Dataset Description

The dataset contains yearly observations and monthly temperature values.

Visualization 1: Annual Temperature Trend

The graph illustrates annual average temperature changes across the years.

Visualization 2: Average Monthly Temperature

The chart compares average temperature values for all months.

Findings

- Summer months are warmer than winter months.
- Temperature varies across decades.
- Historical weather data is useful for predictive analytics.

Conclusion

The project demonstrates real-world data analysis using historical weather records and meaningful visualizations.
